ABSTRACT – Multidrug resistance of foodborne pathogens like Salmonella is a global concern to human health. Organic fertilizer and compost can harbor pathogens since these amendments are subjected to minimal physical and chemical treatments. This study aimed to detect multidrug-resistant Salmonella in 27 samples, representing nine brands, of organic fertilizer and compost using international standard protocols, combining phenotypic and PCR-based methods. Nine isolates from four uncertified brands were confirmed as Salmonella by PCR amplification of the invA gene, and subjected to Kirby-Bauer antibiotic susceptibility test. All isolates were resistant to ampicillin and amoxicillin, but only one was also resistant to two other classes of antibiotics, namely, nalidixic acid and ofloxacin. This shows that multidrug-resistant Salmonella can occur in organic fertilizer, which can potentially contaminate organically grown fresh produce.
